October 5, 2026

Correction notice (2026-10-05). This report was revised after a statistical audit (docs/STATISTICAL_AUDIT_2026-10.md). Changes: (1) the headline “94.2% discriminant accuracy” is a **positive predictive value**; the full diagnostic picture is sensitivity 39.7%, accuracy 86.2% against a 78.1% baseline, and Cohen’s $\kappa = 0.49$; (2) the χ^2 values for mission commissioning (3,018) and volunteer language (599) tested variables that *define* the volunteer group and are circular; (3) “sense of belonging shows no association ($\chi^2 = 0.0$)” and “life transformation shows no association” were produced by a wrong field path and a non-existent field — belonging is in fact associated ($\chi^2 = 252$); (4) the volunteer-detection rule described in Methods did not match the rule used; (5) associations are now adjusted for narrative length; (6) $N = 6,751$ (two duplicate narratives removed; four IANDS records previously mislabelled NDERF). The LaTeX and PDF versions were regenerated from this corrected text.

Abstract

Some near-death experiencers report returning for an “earthly mission”. The Swedenborgian framework proposes that mission-based returns form a distinct category associated with souls who incarnate for specific purposes. We analysed 6,751 NDE records from NDERF ($n=5,659$) and IANDS ($n=1,092$), coded by GPT-5.2 for return reasons, mission commissioning, volunteer language, pre-birth indicators and related features. We use binary “volunteer detection” rather than soul-path classification.

An earthly-mission return reason appeared in 9.2% of NDEs. Of these, 94.2% (95% CI 92.1–95.8) were also coded as having received a mission (positive predictive value), compared with 29.8–60.1% for other return reasons and 9.1% when no reason was given. The reverse does not hold: 60.3% of commissioned experiencers did not cite an earthly mission (sensitivity 39.7%); agreement between the two codes is moderate ($\kappa = 0.49$). Volunteer markers were detected in 695 accounts (10.3%). In the 53 accounts using volunteer language, pre-birth indicators were 10–36 times more frequent, an overlap that is largely definitional. Volunteer-detected accounts also differed on independent features — spiritual “home” identification, explicit belonging, hyper-reality, major value shift and Being-of-Light encounters — with associations that remain after adjustment for narrative length (adjusted ORs 2.0–3.3).

Mission-return narratives form an internally coherent and distinctive cluster. Because all variables are model-coded features of the same retrospective narrative, the data establish that mission commissioning is consistently *reported*, not that it occurred.

Data Provenance

Item	Source	Access
NDERF Records (n=5,659)	Near-Death Experience Research Foundation	nderf.org
IANDS Records (n=1,092)	International Association for Near-Death Studies	iands.org

Extraction Model	GPT-5.2 via Azure OpenAI	Azure OpenAI Service

1 Introduction

1.1 Background

A subset of near-death experiencers report returning not because of family obligation or timing but because they were given, or accepted, an earthly mission (Ring, 1998; Atwater, 2007). Whether this is a distinct phenomenological category or a retrospective framing of an unwanted return has not been systematically examined.

1.2 Theoretical Framework

The Swedenborgian framework distinguishes normative incarnation from incarnation undertaken for specific service. The “volunteer soul” hypothesis (cf. Newton, 1994) proposes that some individuals retain awareness of choosing their life for a purpose. Predictions: mission-returners should report commissioning during the NDE, elevated pre-birth awareness, and a coherent profile of related features.

1.3 Methodological Approach: Detection, Not Classification

We measure whether volunteer-type markers are *reported*. We cannot measure soul paths, first versus returning incarnation, or Ohkado-type “reverse cases” (children with spontaneous pre-birth memory — a different population and method). Pre-birth awareness during an NDE may occur in any experiencer.

Same-source caveat. Every variable is coded by the same language model from the same narrative. When two codes describe overlapping content (“returned for a mission” and “was given a mission”), their association partly reflects the same passage coded twice. Such associations show that narratives are internally coherent; they cannot by themselves show that the reported events occurred.

1.4 Aims

To describe how mission returns relate to commissioning, volunteer language and pre-birth indicators; to characterise volunteer-detected accounts on features that do not define the group; and to state what

these data can and cannot establish.

2 Methods

2.1 Data Sources

NDERF (5,659) and IANDS (1,092); N = 6,751 after removing two duplicate narratives.

2.2 Coding Scheme

Return reasons (multi-select), return agency and willingness, mission commissioned (yes_explicit/implied/no/not_mentioned), volunteer language, premortal existence information, pre-birth realm description, chose mission / parents / life circumstances, identity pre-body, home identification, past-life and prior-death memory, and features not used in detection (belonging, comparative reality, value shift, light encounter).

2.3 Volunteer Detection Rule

A case is flagged if **any** of: volunteer language (explicit or implied); earthly mission among return reasons; or mission commissioned (explicit or implied) **and** chose mission (explicit or implied). (The previous version of this section described the third criterion as “mission commissioned = yes_explicit”, a rule that would flag 898 cases instead of 695.)

2.4 Statistical Analysis

Confusion-matrix diagnostics (PPV, sensitivity, specificity, accuracy, Cohen’s κ); Fisher exact tests; χ^2 with Cramér’s V; Wilson CIs. Volunteer-detected accounts are twice as long as others (median 1,353 vs 635 words), so associations are also reported as odds ratios adjusted for log narrative word count. Tests involving a variable that defines the volunteer group are labelled circular.

3 Results

3.1 Return Reasons

Not your time 21.6%, family responsibility 17.2%, unfinished business 10.5%, earthly mission 9.2% (n = 623), other 3.2%; 44.3% gave at least one reason and 1,034 gave more than one.

3.2 Earthly Mission and Mission Commissioning

Return reason	Mission commissioned (explicit or implied)
Earthly mission (n=623)	94.2% (92.1–95.8)
Unfinished business (n=711)	60.1% (56.4–63.6)
Not your time (n=1,459)	36.7% (34.2–39.2)
Family responsibility (n=1,164)	31.3% (28.7–34.0)
Other (n=218)	29.8% (24.1–36.2)

Return reason	Mission commissioned (explicit or implied)
No reason given (n=3,763)	9.1% (8.2–10.1)

Diagnostic: earthly mission → commissioned	Value
Positive predictive value	94.2% (587/623)
Sensitivity	39.7% (587/1,480)
Specificity	99.3% (5,235/5,271)
Accuracy	86.2% (majority-class baseline 78.1%)
Cohen's κ	0.49
Odds ratio (length-adjusted)	88.9 (95% CI 62.6–126.3)

Finding (corrected). Experiencers who give an earthly mission as their reason for returning are almost always also coded as having received a mission (PPV 94.2%), but most commissioned experiencers give other reasons, so the overall agreement is moderate ($\kappa = 0.49$). “94.2% discriminant accuracy” was a mislabelled positive predictive value.

Interpretation. The association is strong and coherent. Because the two codes describe overlapping content in the same narrative, it cannot distinguish “commissioning occurred during the NDE” from “the return was later framed as a mission”. The earlier statement that the result “cannot be explained by post-hoc rationalization” is withdrawn.

3.3 Volunteer Detection

Volunteer markers were detected in 695 accounts (10.3%, 95% CI 9.6–11.0): 623 via an earthly-mission reason, 53 via volunteer language, and 42 only via commissioning plus chosen mission.

3.4 Volunteer Language and Pre-Birth Indicators

Volunteer language was explicit in 22 accounts and implied in 31 (0.8% together); 4,596 explicitly lacked it and 2,102 did not address it. These 53 accounts are long (median 2,314 vs 676 words).

Indicator	Volunteer language (n=53)	Others (n=6,698)	Rate ratio	Fisher OR	Length-adjusted OR (95% CI)
Incarnation choice (any)	71.7%	2.0%	36	124	73 (37–144)
Pre-birth realm description	34.0%	1.5%	22	33	14 (7.5–28)
Premortal existence information	69.8%	6.6%	11	33	18 (9.0–35)

Indicator	Volunteer language (n=53)	Others (n=6,698)	Rate ratio	Fisher OR	Length-adjusted OR (95% CI)
Home = spiritual realm	58.5%	16.8%	3.5	7.0	3.6 (2.0–6.4)
Identity pre-body	79.2%	34.6%	2.3	7.2	3.9 (2.0–7.9)

Finding. Pre-birth indicators are strongly elevated in volunteer-language accounts, beyond what narrative length explains. However, “volunteering to incarnate” *semantically entails* pre-birth existence and a choice to incarnate, so co-occurrence of these codes is largely definitional. With 53 accounts, intervals are wide.

3.5 Profile of Volunteer-Detected Accounts

Characteristic	Volunteer-detected (n=695)	Not detected (n=6,056)	Length-adjusted OR (95% CI)	Status
Mission commissioned	92.7%	13.8%	—	Defines the group
Volunteer language	7.6%	0%	—	Defines the group
Pre-birth awareness	29.4%	5.1%	4.7 (3.8–5.9)	Partly definitional
Continuation memory	14.0%	3.3%	2.8 (2.1–3.6)	Independent
Home = spiritual realm	41.4%	14.4%	3.0 (2.5–3.5)	Independent
Sense of belonging (explicit)	25.0%	9.1%	2.2 (1.8–2.8)	Independent
More real than earthly reality	36%	14%	2.0 (1.7–2.4)	Independent
Major value shift	58%	26%	2.6 (2.2–3.1)	Independent
Being of Light (light_encounter)	32%	9.5%	3.3 (2.7–4.0)	Independent

Finding (statistically supported). Volunteer-detected accounts differ on several features that play no part in the detection rule, and these associations remain after adjustment for narrative length. The earlier statement that “sense of belonging ... $\chi^2 = 0.0$... the profile is specific, not global” was an artifact of reading the field from the wrong section; belonging is associated with volunteer detection ($\chi^2 = 252.1$, $df = 3$, $p < 10^{-53}$, $V = 0.19$).

3.6 Continuation Memory

Past-life memory appears in 4.4% of NDEs, intermission memory in 1.0%, and memory of a prior death in 0.5% (36 accounts, 19 violent; previously reported as 0 because the wrong values were matched). Past-life memory co-occurs *positively* with volunteer language (4.4% vs 0.6%; OR 7.3), mission commissioning (52.9% vs 20.5%; OR 4.3) and earthly-mission returns (25.3% vs 8.5%; OR 3.6). This is compatible with “past-life memory” in NDE narratives often reflecting remembered pre-existence rather than prior earth lives, but the data cannot distinguish the two.

3.7 Pre-Birth Indicator Count

Zero indicators 92.4%, one 4.9%, two 2.0%, three 0.7% ($n = 47$). Of the 47 accounts with all three, 41 (87.2%) are volunteer-detected — partly by construction, since “chose mission” contributes both to the count and to the detection rule.

3.8 Statistical Tests

Variable $\times$ volunteer detection	χ^2	df	V	Status
Mission commissioned	3,017.0	3	0.67	Circular
Volunteer language	599.2	3	0.30	Circular
Pre-birth awareness	515.5	1	0.28	Partly circular
Return agency	696.5	4	0.32	Independent
Return willingness	284.8	4	0.21	Independent
Sense of belonging	252.1	3	0.19	Independent
Comparative reality	223.3	3	0.18	Independent
Continuation memory	164.7	1	0.16	Independent

All $p < 10^{-37}$. Circular tests are not evidence for the category.

4 Discussion

4.1 Summary of Corrected Findings

Mission-return narratives are coherent: an earthly-mission reason almost always comes with a reported commissioning, volunteer language almost always with pre-birth content, and volunteer-detected accounts differ on several independent features (spiritual home, belonging, hyper-reality, value change, Being of Light) even after accounting for how much the narrative says.

4.2 What the Data Support

- A recognisable cluster of mission-related reports exists in about one in ten NDE accounts.
- The cluster is associated with features outside its definition, so it is not merely a by-product of the detection rule.

- The framework’s prediction that mission-returns report commissioning and pre-birth awareness is **consistent with** the data.

4.3 What the Data Cannot Support

- That commissioning *occurred*: all evidence is the same retrospective narrative coded twice.
- That mission returns are not retrospective meaning-making: the data contain no measure that would distinguish the two.
- Soul-path classification, first versus returning incarnation, or Ohkado-type reverse cases.
- That non-detection means non-volunteer.

4.4 Implications

Clinically, mission-return accounts are coherent and warrant respectful engagement; their coherence does not, however, establish their accuracy, and clinicians need not adjudicate it. For research, longitudinal follow-up (do mission-returns report pursuing the stated mission?) and independent corroboration would test what the narrative data cannot.

4.5 Limitations

LLM extraction without human validation; self-selected archives; mission and volunteer language may be culturally available framings; volunteer-language $n = 53$; detection is rule-dependent (695 vs 898 under the alternative rule).

4.6 Future Directions

Human coding of mission content; prospective and longitudinal designs; cross-cultural samples; schema fields that separate *when* in the narrative the mission was given from *how* the return was explained.

5 Conclusion

In 6,751 near-death experiences, about 10% contain volunteer or mission markers. Mission returns and reported commissioning go together (PPV 94.2%, $\kappa = 0.49$), volunteer language goes with pre-birth content, and mission-oriented accounts differ from others on several independent features after narrative length is controlled. These results show a coherent, distinctive pattern of *reports*. They do not show that commissioning took place, and the earlier claims of “94.2% discriminant accuracy” and validation by χ^2 tests on defining variables have been withdrawn.

A Statistical Summary

Test	Value
Earthly mission → commissioned: PPV / sensitivity / specificity	94.2% / 39.7% / 99.3%
Accuracy vs baseline	86.2% vs 78.1%
Cohen's κ	0.49
Volunteer $\times$ belonging (independent)	$\chi^2 = 252.1$, df = 3, V = 0.19
Volunteer $\times$ return agency (independent)	$\chi^2 = 696.5$, df = 4, V = 0.32
Volunteer $\times$ mission commissioned	$\chi^2 = 3,017.0$ (circular)

B Key Statistics

Metric	Value
Total NDEs analyzed	6,751
Earthly-mission return reason	623 (9.2%)
Volunteer markers detected	695 (10.3%)
Volunteer language	53 (0.8%)
Pre-birth awareness	515 (7.6%)
Continuation memory	298 (4.4%)
Home is spiritual (volunteer / not)	41.4% / 14.4%

C Methodological Notes

Volunteer detection measures the presence of reported mission markers. It does not measure soul path, first versus returning incarnation, Ohkado-type pre-birth memory, or restorative path (which requires DOPS-type verified data).
